

AWS and Trend Micro: A blueprint for a successful cloud migration

Migrating to the cloud? Smart move. Here's why:

61%

of businesses migrated their workloads to the cloud in 2020, and AWS had a 76% share of those moves.¹

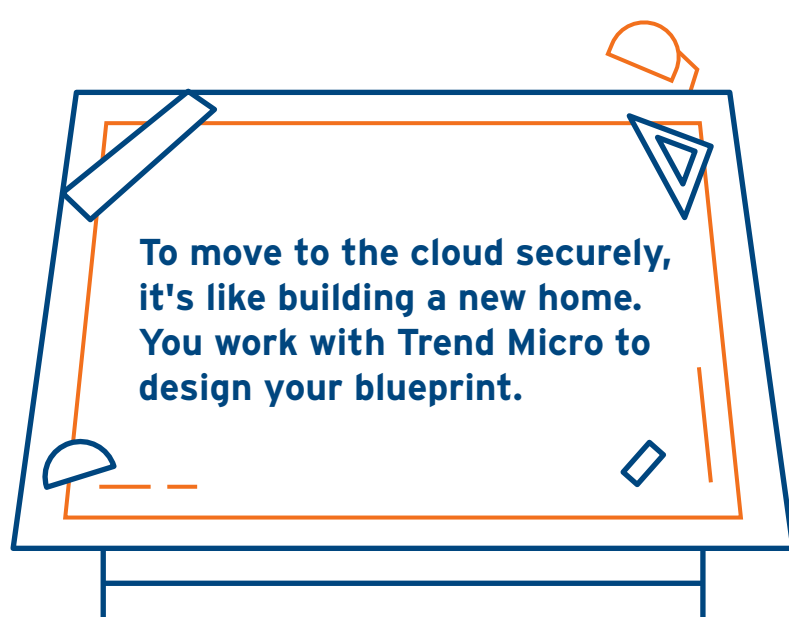

43%

of IT decision-makers said greater platform and service flexibility were the top benefits of using public cloud services like AWS.²

41%

of companies say that a major benefit of moving to AWS is improved business continuity.³

Security is different in the cloud. AWS has a Shared Responsibility Model. It secures the cloud infrastructure, and you secure the workloads, applications, and data you run on AWS. That's where Trend Micro comes in. We currently protect tens of thousands of workloads on AWS.

Trend Micro Cloud One™ Workload Security

The doors

In the same way doors keep intruders out, agent-based security monitoring locks out potential threats.

Trend Micro Cloud One™ Network Security

The walls

Like walls that ensure you're safe inside, a layered security approach ensures your network is protected from harm.

Trend Micro Cloud One™ File Storage

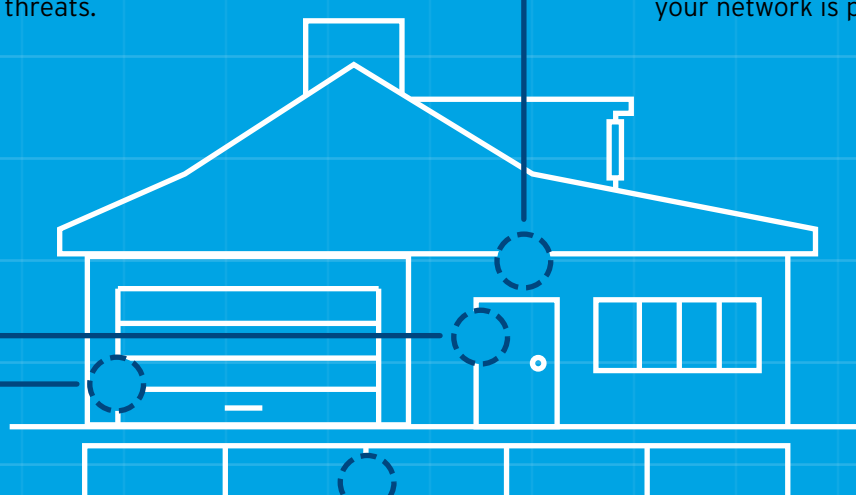

The garage

Just as a garage protects your interior from damage, anti-malware keeps threats from getting into an Amazon S3 bucket and causing damage or issues downstream.

Trend Micro Cloud One™ Conformity

The foundation

Just like a slab foundation and pillars keep your house from sinking into the ground, a solid foundation for your AWS migration provides checks and balances that help you build in the cloud with confidence.

Trend Micro Cloud One™, a security services platform for cloud builders, is an automated, flexible, and all-in-one security option for building in the AWS cloud. According to Forrester Consulting, projected savings are between 2,100 and 6,200 hours for security administration and 19% to 27% for costs of threat detection and response.⁴
